Information compiled by J.P. Hindle, Department of Agriculture.
Base map compiled from Central Mapping Authority 1:25 000 and 1:31 680 Topographic maps.

Published by Department of Agriculture in conjunction with the Central Mapping Authority , 1986.

Printed by the Central Mapping Authority.

Land Classes

1

Class 1
Arable alluvial land with deep, fertile soils having a very good capability for agriculture. These lands have only minor or no constraints to sustained high to very high levels of production.

2

Class 2
Arable lands having a very good capability for agriculture. Minor to moderate constraints to sustained high levels of production are present.

3

Class 3
Lands well suited to posture improvement and associated pasture management practices. These lands may be cultivated for an occasional crop depending on the nature of the constraint. Overall there is good capability for agriculture.

4

Class 4
Grazing lands not suited to cultivation. Agricultural capability is based on native pastures and/or improved pastures relying on aerial or zero tillage establishment techniques.

5

Class 5
Lands not suited to agriculture, or suited only to rough grazing. Agricultural production, if any, is very low.

Map Users Note

This map provides a generalised analysis of land suitability based largely on landscape, soils and agronomic data. The map was compiled by the Department of Agriculture, New South Wales for use by that Department and the Department of Environment and Planning to assist with the preparation of Regional and Local Environmental Studies in the Illawarra region. The Agricultural Land Suitability Classes have been delineated by field observation, air photo-interpretation and the use of topographic maps.

The maps must not be enlarged. They will be reliable at a scale of 1:50 000 but there may be anomalies regarding specific details and land class boundaries. For details of interpretation see accompanying report.
